A vent gas scrubber system is an air pollution control device designed to remove harmful or hazardous substances—such as acidic gases, volatile organic compounds (VOCs), ammonia, or particulate matter—from exhaust gas streams before they are released into the atmosphere. These systems are commonly used in industrial processes, chemical storage tank vents, and manufacturing facilities where emissions must be treated to comply with environmental regulations. A vent gas scrubber typically works by bringing the contaminated gas into contact with a scrubbing liquid (usually water or a chemical solution) within a packed column or spray tower, where absorption, neutralization, or chemical reaction takes place. The cleaned gas is then safely vented, while the scrubbing liquid, now containing the removed pollutants, is either treated or recirculated. Vent gas scrubber systems play a crucial role in reducing environmental impact, improving workplace air quality, and maintaining regulatory compliance in industries such as petrochemicals, pharmaceuticals, wastewater treatment, and food processing.
