Trauma and tumors can cause hydrocephalus, which increases the pressure on the patient's brain and leads to a series of neurological symptoms. Ventricular drainage can change these symptoms. Usually, most patients with hydrocephalus caused by brain tumors disappear after the brain tumor is removed, while hydrocephalus caused by other causes with increased cerebrospinal fluid pressure must be treated by surgery. Because the clinical use of extraventricular shunt method. This method is simple and reliable. The current shunt system consists of two sections of conduit and a one-way valve. The catheter to be placed at the end of the ventricle is called the proximal catheter. Catheters intended to be placed in the abdominal cavity, or occasionally in the right atrium, are called distal catheters. Both catheters are connected to a one-way valve that controls the flow, flow and pressure of the cerebrospinal fluid.
