Venturi Desuperheater is capable of obtaining a stable conditioned desuperheated steam flow to control the temperature and can handle a high amount of cooling water in a very short time span. The working principle of the Desuperheater is based on the Venturi (vena contracta) principle, which generates dynamical energy inside the Desuperheater, where cooling water is suctioned-in and atomized in fine cooling water droplets by the special wing-shaped spray nozzle design. The combination of the Venturi and the wing-shaped spray nozzle generates high turbulence (vortex) and secures rapid and total evaporation in a very short time period.
