Centrifugal water pumps are any pump that induces flow or raises pressure of a liquid which results in a pumping action. The centrifugal is the preferred hydraulic pump and is used in over 95% domestic and industrial applications. They are low in cost and maintenance, simple to operate and as a result are used universally.

Inside the case of the pump lies a impeller, which consists of a set of curved vanes. These vanes rotate when submersed in water which with it rotates the liquid. By doing this it builds up a centrifugal force to the water particles and forces the water out. An easy way to imagine this is the effect of water flicking off a car tyre on a wet road. Rather than a scooping action from the vanes on the impeller the force comes centrifugally.
