The global Vertical Gear Rolling Machine market size is predicted to grow from US\$ 458 million in 2025 to US\$ 582 million in 2032; it is expected to grow at a CAGR of 3.5% from 2026 to 2032.

A vertical gear rolling machine is a mechanical device with a vertical layout, which is specially used for rolling various gears. It realizes the cutting of the gear teeth through the relative movement of a pair of gear rolling cutters, so as to obtain precise tooth shape and good surface quality. The characteristics of this equipment are its compact structure, small footprint, easy operation, and ability to adapt to the processing needs of gears of different specifications. The advantage of the vertical gear rolling machine lies in its high-efficiency processing capability. It can complete the gear rolling operation of a large number of gears in a short time while maintaining processing accuracy and stability. Moreover, its unique vertical design helps to improve the efficiency of cutting fluid use, reduce heat accumulation, and extend tool life. In addition, the vertical gear rolling machine is usually equipped with an automated control system, which can realize continuous operation and unmanned operation, greatly reducing labor costs and improving production efficiency. It is an efficient, stable and reliable processing equipment in the field of gear processing.
