The global Vertical Gyroscope market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Vertical gyroscopes are devices found in the inertial navigation systems and basic input systems of various types of aviation instruments and are used to measure the roll angle (roll) and pitch angle (attitude) of the spacecraft. It can accurately measure the attitude angle of the aircraft and output an electrical signal proportional to the attitude angle, which is provided to the computer and finally displayed on the instrument. The entire device of the vertical gyroscope is divided into upper and lower parts. The upper half contains the electromechanical equipment of the gyroscope, and the lower half contains all the system electronics.
