The global Very High Flexion Tractor Tyre (VF Tractor Tyre) market size is predicted to grow from US\$ 1653 million in 2025 to US\$ 2506 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

The core feature of very high flexion (VF) tractor tyre is the increased contact patch through significantly enhanced tire deformation, thereby reducing soil compaction, improving traction, and reducing fuel consumption. It is an agricultural tire employing special structural and material technologies, with a sidewall design exhibiting extremely high flexibility. Compared to standard tires, it can increase load by approximately 40% at the same tire pressure, or reduce tire pressure by approximately 40% at the same load. This is primarily driven by modern agriculture's pursuit of sustainable and intensive development: upstream, large agricultural machinery is continuously increasing power and weight to improve efficiency, leading to increasingly serious soil compaction problems that threaten arable land health and long-term yields; downstream, farmers and agricultural operators urgently need a solution that can protect the soil while supporting heavy agricultural machinery. Its supply chain involves upstream innovative suppliers of specialty synthetic rubber, high-strength steel cord, and flexible tire carcass materials, as well as specialized tire mold and intelligent manufacturing equipment manufacturers; downstream, it closely connects with agricultural machinery manufacturers for complete vehicle assembly, and covers end-farms through agricultural machinery dealers and professional service centers, relying on central tire pressure control system suppliers to achieve optimal tire performance. The entire supply chain responds to the core market demands of reducing soil compaction, improving operational efficiency, and reducing fuel consumption, driving the upgrading of agricultural tires towards high technology and high added value. By 2025, the production of very high flexion tractor tires is expected to reach approximately 1.3

million units, with an average selling price of approximately US\$1,300 per tire, a gross profit margin of approximately 30%, and a single production line capacity of approximately 20,000 units per year.

The core market drivers for very high flexion tractor tires can be summarized as follows: First, the fundamental driving force is the global agricultural shift towards soil health and sustainable intensive farming. As tractor power and weight continue to increase to improve operational efficiency, soil compaction caused by traditional tires has become a core bottleneck restricting long-term farmland productivity. VF tires, with their unique design that can reduce tire pressure by 40% under the same load, significantly increase the contact area and reduce soil compaction. Second, the widespread adoption of the Central Tire Inflation and Deflator System (CTIS) has fully realized the technological potential of VF tires. Operators can adjust tire pressure in real time from the cab according to working conditions, achieving low pressure to protect the soil in the field and restoring high pressure during road transport to ensure safety and fuel economy. This 'deformation on demand' capability directly drives market demand for VF tractor tires. Third, the continuous improvement of tractor operating efficiency standards, and the increasing demand for modern tractor tires... Tractors not only require stronger traction but also commonly face the need for road transport at speeds of 40-65 km/h. Traditional tires are prone to overheating and failure under high-load, high-speed conditions, while VF tires are a crucial technological solution to meet these demanding requirements. Furthermore, fuel economy and optimized life-cycle costs are the direct economic drivers for farmers adopting VF tires. By reducing tire pressure, rolling resistance and slippage are decreased, significantly reducing fuel consumption (efficiency improvement of up to 4%). Simultaneously, the more even distribution of ground pressure extends tire life, ultimately translating into tangible profit margins. Finally, the maturity of tire technology and the comprehensive coverage of product lines have allowed VF technology to expand from its initial focus on high-end tractor drive wheels to include front and rear axle components and various horsepower ranges. Many brands are also extending VF technology to mid-range product lines, making the return on investment for this technology sufficiently attractive to ordinary farms.
