## Abstracts

The global Very High Flexion Tyre (VF Tyre) market size is predicted to grow from US\$ 7924 million in 2025 to US\$ 12010 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Very high flexion tyre was developed to fundamentally address the core contradiction of balancing load-bearing capacity and ground protection during heavy machinery operations. Upstream agricultural and construction machinery manufacturers, in their pursuit of increased productivity, are constantly introducing larger and heavier equipment, leading to soil compaction and ground damage—bottlenecks hindering sustainable development. Downstream farmers, contractors, and mining and port operators must ensure high-intensity operations while striving to protect the soil, lawns, or paved ground assets upon which they depend. Ultra-high flexibility tires are modern radial tires that, through revolutionary tire structure and material formulations, possess ultra-high radial deformation capacity in the sidewalls. This allows them to safely withstand the same load at approximately 40% lower working pressure than standard tires of the same size, or to withstand approximately 40% higher load at the same pressure. Their upstream supply chain heavily relies on advanced chemical and material suppliers of specialty synthetic rubbers, high-strength steel cord/aramid fibers, and flexible composite materials. Downstream, they are directly integrated into new equipment from OEMs and reach end users through a vast dealer and service network, while also collaborating deeply with suppliers of Central Tire Pressure Management (CTIS) systems. In 2025, the production of very high flexion tyre will be approximately 4.5 million units, with an average selling price of approximately US\$1,800 per tire, a gross profit margin of approximately 35%, and a single production line capacity of approximately 60,000 units per year.
