Vesanoid is medication used for the treatment of acne and acute promyelocytic leukemia. For acne, it is applied to the skin as a cream or ointment. For leukemia, it is taken by mouth for up to three months.

The Vesanoid (Tretinoin) market driver is its established efficacy in treating acute promyelocytic leukemia (APL). It induces differentiation of leukemia cells, leading to remission. Its niche target population and limited treatment options contribute to its growth. However, challenges include potential side effects, the need for careful patient monitoring, and resistance to treatment in some cases. Additionally, competition from other APL therapies and access to affordable medication pose challenges. Despite challenges, Vesanoid's effectiveness and ongoing research in APL present opportunities for market expansion.
