The global Vessel-mounted ADCP market size is predicted to grow from US$ 74.8 million in 2025 to US$ 104 million in 2031; it is expected to grow at a CAGR of 5.6% from 2025 to 2031.

A vessel-mounted ADCP relies on the same principles as a stationary ADCP, producing a profile of the currents between the vessel and the seabed.However, vessel-mounted ADCPs encounter an extra layer of complication while measuring, because the vessel on which they are mounted is moving. This means the ADCP will have to account for the speed and direction of the vessel when determining the velocity of the currents beneath it. Thankfully, an ADCP can also calculate the speed of the vessel over the seabed, using a technique called “bottom tracking.” To perform bottom tracking, the ADCP measures the Doppler shift of a ping that bounces off the seabed, rather than scatterers in the water like with current measurements. This effectively measures the speed of the vessel relative to the sea floor.

United States market for Vessel-mounted ADCP is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Vessel-mounted ADCP is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Vessel-mounted ADCP is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
