The report requires updating with new data and is sent in 48 hours after order is placed.

Veterinary radiography consists of diagnostic medical images generated in veterinary practice, including ultrasonography, CT, MRI, and nuclear imaging. It is essential in providing excess information by noninvasive means. Veterinary radiography is painless; however, sedation is often required to reduce anxiety and stress associated with the procedure in animals.

The major factors that drive the growth of the market are increase in animal healthcare expenditure, growth in pet insurance purchase, and rise in preference for companion animals. In addition, increase in veterinary practitioners and surge in disposable income in developed regions supplement the market growth. However, high cost of veterinary imaging instruments and dearth of skilled professionals restrain this growth. Moreover, the development of portable veterinary radiography devices is expected to offer lucrative opportunities for the expansion of this market.

Over the next five years, LPI(LP Information) projects that Veterinary Radiography will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Veterinary Radiography market for 2018-2023.
