## Abstracts

The global Veterinary Regenerative Medicine market size is predicted to grow from US\$ 365 million in 2025 to US\$ 849 million in 2032; it is expected to grow at a CAGR of 13.1% from 2026 to 2032.

Regenerative medicine aims to restore the normal function of diseased or damaged cells, tissues, and organs using a set of different approaches, including cell-based therapies. In the veterinary field, regenerative medicine is strongly related to the use of mesenchymal stromal cells (MSCs), which belong to the body repair system and are defined as multipotent progenitor cells, able to self-replicate and to differentiate into different cell types.

Regenerative medicine therapy has grown in popularity in both human and veterinary medicine for the treatment of a variety of disease conditions. In the rapidly developing field of veterinary regenerative medicine, cells, and tissues-such as live cells, serum, or bone-are utilized in animals with the hopes of restoring diseased or damaged tissues or organs. Recent studies have shown that it is effective in controlling a variety of orthopedic disorders in companion animals, including osteoarthritis and soft tissue injuries. Regenerative medicine is increasingly used as an alternative to surgical, medicinal, and rehabilitation therapy or as a multimodal approach to treating a condition or injury.
