A high-frequency electrosurgical device is an electrosurgical instrument that replaces a mechanical scalpel for tissue cutting. It heats the tissue when the high-frequency and

high-voltage current generated by the effective electrode tip contacts the body, and realizes the separation and coagulation of the body tissue, thereby achieving the purpose of cutting and hemostasis. Electrocutation is a high-density current that causes the temperature of the cell to rise rapidly over 100 degrees Celsius, and the pressure of the gasification of the liquid in the cell causes the cell membrane to be ruptured.
