## Abstracts

The global VFD Customer Pole Display market size is predicted to grow from US\$ 115 million in 2025 to US\$ 151 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

VFD Customer Pole Display is a specialized point-of-sale (POS) peripheral device that utilizes Vacuum Fluorescent Display (VFD) technology to present real-time transaction information directly to customers during checkout processes. Unlike LCD displays, VFD models rely on cathode-ray excitation of fluorescent phosphors to produce bright, high-contrast characters—most commonly in blue-green, green, or amber hues—offering excellent readability in varying lighting conditions, from dim indoor retail spaces to sunlit storefronts. Designed for basic transactional needs, VFD customer pole displays are valued for their low power consumption, long operational lifespan, and compatibility with both legacy and modern POS systems via standard interfaces such as RS-232 serial and USB. Cost-effective and technologically mature, they are widely deployed in budget-conscious environments including convenience stores, gas stations, supermarkets, and quick-service restaurants, where core transaction transparency is prioritized over advanced features like color graphics or interactive touch functionality.

In 2025, global VFD Customer Pole Display production reached approximately 1,113 K units, with an average global market price of around US\$ 106 per unit. The production capacity of VFD Customer Pole Display is approximately 1,400 K units per year, the average gross profit margin was 28-30%.

The upstream supply chain of VFD Customer Pole Display includes raw material suppliers providing glass substrates, fluorescent phosphors, metal alloys, plastic resins and cathode materials, core component manufacturers producing VFD panels, cathode

emission assemblies, driver ICs, control circuit boards, RS232/USB interface modules, adjustable poles and housing structures, as well as firmware developers creating POS-compatible software for real-time transaction data synchronization. These inputs are delivered to midstream manufacturers that conduct component assembly, functional testing and strict quality control to produce finished VFD customer pole displays, ensuring compatibility with both legacy and modern POS systems. The downstream supply chain covers distributors, value-added resellers and POS system integrators that bundle the displays with POS terminals, payment systems and related software into integrated solutions, then distribute them to end-users across retail, convenience stores, gas stations, restaurants and banking industries.

The cost structure of VFD Customer Pole Display is dominated by direct material costs, accounting for 60-70% of total costs, with VFD panels being the single largest expense, followed by driver ICs, control circuit boards, structural components and power adapters. Direct labor costs, covering assembly, quality testing and packaging processes, account for 8-12% of total costs, while manufacturing overhead including facility operation, equipment depreciation and utilities takes up 5-10%. Additional costs include research and development (2-4%) for POS system compatibility upgrades and firmware optimization, which is relatively low due to the mature VFD technology; logistics and tariffs (4-7%) for cross-regional transportation and import duties on core components; and sales and marketing expenses (2-3%) for channel promotion and customer outreach.
