In the peripheral blood of camel species such as alpacas, there is an antibody that naturally lacks light chains. It is a natural dimer formed by two heavy chains, called a heavy chain antibody. The variable region of this heavy chain antibody is called VHH, which can bind to antigens as a single molecule and has high affinity and high specificity. VHH crystals are 2.5nm, 4nm long, and have a molecular weight of only 15 kDa, so they are also called nano antibodies. VHH is not as easy to adhere to each other as artificially modified single-chain antibody fragments (scFV), but is more stable and can even be stored at room temperature. The half-life of nano antibodies can be extended and antibody drugs can be produced by constructing bifunctional domain or trifunctional domain antibodies that recognize HSA, or constructing Fc fusion proteins.
