A vibrating flour sifting machine is a mechanical device that separates and screens powders or granular materials of different particle sizes based on the principle of vibration. When the powder or granular material enters the screening box, it is subjected to the combined action of vibration and gravity on the screening surface. Materials smaller than the sieve pore size fall through the sieve holes to the lower layer, while materials larger than the sieve pore size remain on the screening surface, thereby achieving the separation and screening of materials of different particle sizes.
