Vibration Damping Alloys are, as the name might suggest, alloys used to dampen vibrations in machines and structures. Vibration can shorten the life of machinery and cause noise and discomfort. Vibration damping alloys are materials developed to solve these problems. They dampen vibration by converting mechanical energy into thermal energy. This property is used to increase the earthquake resistance of large structures such as buildings and bridges. They are also used in vibration-sensitive products such as precision equipment and audio equipment.

The global Vibration Damping Alloy market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
