The movement of the vibrating sorting screen is driven by a motor through a V-belt with an eccentric mass vibration exciter, so that the sieve bed undergoes periodic asymmetric reciprocating mechanical vibration, so that the material layer on the screen surface is loosened and thrown away from the screen surface. It can make the fine materials fall through the material layer, separate through the sieve holes, and shake out the materials stuck in the sieve holes. The fine materials move to the lower part and are removed through the sieve.
