A vibrating online viscometer is a viscometer that measures the viscosity of a fluid by measuring the vibration frequency of a sensor immersed in the fluid. Sensors are usually vibrating components, such as tuning forks or quartz crystals, which are excited to vibrate at a specific frequency. The viscosity of a fluid affects the frequency of

vibration, and this change in frequency is used to determine the viscosity of the fluid. These viscometers are typically used in industrial applications that require continuous monitoring of fluid viscosity, such as in the chemical, food and beverage, and pharmaceutical industries. They are also used for research and development of fluid properties. One of the advantages of vibration type online viscometers is that they can provide real-time measurement of fluid viscosity without the need for manual sampling or laboratory testing. This allows for more efficient and precise process control in industrial applications.
