A video progressive scan camera is a type of camera that captures video footage using a progressive scanning method. Progressive scanning is a technique where each frame of the video is captured and displayed in its entirety, rather than using an interlaced scanning method where each frame is split into two fields and displayed alternately.

The progressive scan camera captures the entire frame at once, resulting in a smoother and more detailed video image. This is particularly beneficial for capturing fast-moving objects or scenes with a lot of motion, as it reduces motion blur and provides a clearer image.

Video progressive scan cameras are commonly used in various applications, including surveillance systems, broadcasting, video production, and professional photography. They are also found in consumer-grade video cameras and smartphones, where they contribute to improved video quality.
