The global Video Wall Processors market size is predicted to grow from US\$ 5274 million in 2025 to US\$ 10960 million in 2031; it is expected to grow at a CAGR of 13.0% from 2025 to 2031.

A video wall controller (sometimes called “processor”) is a device that splits a single image into parts to be displayed on individual screens.

Some video wall controllers can reside in the server room and communicate with their 'graphics cards' over the network. This configuration offers advantages in terms of flexibility. Often this is achieved via a traditional video wall controller (with multiple graphics cards) in the server room with a 'sender' device attached to each graphics output and a 'receiver' attached to each display. These sender/receiver devices are either via Cat5e/Cat6 cable extension or via a more flexible and powerful 'video over IP' that can be routed through traditional network switches. Even more advanced is a pure network video wall where the server does not require any video cards and communicates directly over the network with the receiver devices.
