The global Vinyl Versatate market size is predicted to grow from US\$ 465 million in 2025 to US\$ 832 million in 2031; it is expected to grow at a CAGR of 10.2% from 2025 to 2031.

In the 1950s, Dr. Herbert Koch from the Max Plank Institute in M?lheim, Germany, found that olefins may react with carbon monoxide and water under the influence of strong acids to form tertiary branched neocarboxylic acids. Before the intermediate carbocation reacts with carbon monoxide, isomerization reactions are observed and, therefore, the resulting acid is composed of a number of isomers.

The neocarboxylic acid can be converted into its vinyl ester monomer by reaction with acetylene. Today, these monomers are widely referred to in industry as vinyl versatate monomers (CAS: 51000-52-3), neo-esters or VV monomers.

Vinyl Versatate are commonly used in vinyl acetate and acrylic polymers where they greatly improve hydrolytic stability, adhesion, water and UV resistance.

The market for vinyl versatate is highly concentrated. There are only two manufactures in the world: Hexion and TJSHIELD. Among them, Bemis Associates is the larger one with the percentage of 70.50% market share in 2019.
