An application delivery controller (ADC) is a network component that manages and optimizes how client machines connect to web and enterprise application servers. In general, a controller is a hardware device or a software program that manages or directs the flow of data between two entities.

An ADC performs load balancing between servers and accelerates applications. As the technology has evolved, newer ADC offerings have expanded functions that surpass traditional load balancers and first-generation ADCs, such as Secure Sockets Layer (SSL) offloading, rate shaping or firewalls for web applications.

An ADC can be deployed physically as a hardware appliance or virtually as software, running on an 86x server. Virtual application delivery controllers are particularly useful in large enterprise data centers and cloud computing environments where customers need to be able to scale capacity up and down as application demand fluctuates.
