Abstracts

According to this study, the global Virtual Private Servers (VPS) market size will reach US\$ million by 2031.

A virtual private server (VPS) is a virtual machine sold as a service by an Internet hosting service. A VPS runs its own copy of an operating system (OS), and customers may have superuser-level access to that operating system instance, so they can install almost any software that runs on that OS. For many purposes they are functionally equivalent to a dedicated physical server, and being software-defined, are able to be much more easily created and configured. They are priced much lower than an equivalent physical server. However, as they share the underlying physical hardware with other VPSes, performance may be lower, depending on the workload of any other executing virtual machines.

China, Japan, and India have significant potential for the global VPS vendors, because of the availability of significant proportion of end-user verticals, favorable economic conditions by extending services to these regions, multifold increase in the adoption rate of virtualization environment-based applications, and absence of intense competition for market entrants.
