The global Virtual Screening Service market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Virtual screening service is a process in which computer algorithms and software are used to screen large databases of chemical compounds or molecules in order to identify potential drug candidates or molecules with desired properties. It is a cost-effective and time-efficient method for drug discovery and development.

Virtual screening service involves the use of computational models and algorithms to predict the biological activity, pharmacokinetics, and toxicity of compounds. It can be used to identify potential drug targets, optimize lead compounds, and prioritize compounds for further experimental testing.

The process typically involves the following steps:

1. Database preparation: The chemical database is prepared by converting the compounds into a suitable format for virtual screening.
2. Target selection: The specific target or protein of interest is selected for screening. This could be a disease-related protein, enzyme, receptor, or any other biological target.
3. Ligand-based or structure-based screening: Virtual screening can be performed using ligand-based or structure-based methods. Ligand-based methods use known active compounds as references to identify similar compounds in the database. Structure-based methods involve docking the compounds into the target protein's binding site to

predict their binding affinity.

4. Scoring and ranking: The screened compounds are scored and ranked based on their predicted activity, binding affinity, or other desired properties. The top-ranked compounds are considered as potential drug candidates.

5. Experimental validation: The selected compounds are further tested in vitro or in vivo to validate their activity and properties. This step involves laboratory experiments and can lead to the identification of lead compounds for further development.

Virtual screening service has become an integral part of the drug discovery process, as it allows researchers to quickly screen large chemical databases and identify potential drug candidates with reduced time and cost compared to traditional experimental screening methods.

United States market for Virtual Screening Service is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
