Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Virus Cryopreservation market.

Virus cryopreservation is a biotechnology that allows long-term preservation of virus in living tissues or in suspension medium by freezing them at very low temperatures, usually below -70°C. The aim of virus cryopreservation is to maintain the viability and infectivity of the virus without altering its genetic stability. Virus cryopreservation requires the use of cryo-protectant agents, such as glycerol, dimethyl sulfoxide (DMSO) or fetal bovine serum (FBS), to prevent ice crystal formation and damage to the virus structure.
