According to our LPI (LP Information) latest study, the global Virus Filtration Membrane market size was valued at US\$ million in 2023. With growing demand in downstream market, the Virus Filtration Membrane is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Virus Filtration Membrane market. Virus Filtration Membrane are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Virus Filtration Membrane. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Virus Filtration Membrane market.

Virus filtration (VF) is a key step in an overall viral clearance process since it has been demonstrated to effectively clear a wide range of mammalian viruses with a log reduction value (LRV) > 4 . The potential to achieve higher LRV from virus retentive filters has historically been examined using bacteriophage surrogates, which commonly demonstrated a potential of > 9 LRV when using high titer spikes (e.g. 10^{10} PFU/mL). However, as the filter loading increases, one typically experiences significant decreases in performance and LRV.
