Viruses are used as pesticides to achieve disease resistance and insecticide, and can play a short-term control role for microbial pesticides. After use, it is possible for the virus to exist in the agricultural and forestry ecosystem for a long time, and as a kind of introduced ecological factor, it plays a role in regulating the population density of pests. This is an insecticide that has the effect of comprehensively killing insects and controlling the number of pest populations. It has created a new era of insecticides. The key difference from other pesticides is that it can form a 'pest plague' in the pest population. , It is not easy to produce resistance, convenient and safe high-efficiency insecticide.
