Abstracts

According to this study, the global Visual Impairment market size will reach US\$ 8721 million by 2031.

Visual impairment can be any kind of vision loss, whether it is the condition in which someone cannot see at all or someone has partial vision loss. Some conditions which can cause vision loss after birth are cataracts, amblyopia, diabetic retinopathy, glaucoma, macular degeneration, etc. When one or more parts of the eye or brain that are needed to process images become diseased or damaged, severe or total loss of vision can occur. In these cases, vision cannot be fully restored with medical treatment, surgery or corrective lenses like glasses or contacts. In such situations of visual impairment, assistive technologies for visual impairment can be used. This assistive technology for visual impairment can be assistive, adaptive, and rehabilitative devices for the people with disabilities.

The increasing prevalence of visual impairment & blindness is a major factor responsible for growth of the global visual impairment market. For instance, as per World Health Organization (WHO), over 1 billion people had a near or distance vision impairment globally. Furthermore, increasing prevalence of eye disorders such as diabetic retinopathy, refractive error, glaucoma, cataract, and age-related macular degeneration is projected to increase the number of visually impaired people globally, thereby fueling demand for assistive technologies in visual impairment. This will, in turn, drive growth of the global visual impairment market. For instance, as per World Glaucoma Association, it is estimated that over 80 million individuals will have glaucoma in 2023. This number is likely to increase to 111.8 million individuals in 2040.
