The visual tracheal intubation scope is an advanced medical device that integrates a camera and a display system. It is used to provide real-time, high-definition visual images during the tracheal intubation process, assisting doctors to visually observe the patient's throat, glottis and airway structure, thereby improving the accuracy and success rate of intubation. Compared with traditional blind intubation or direct viewing laryngoscopes, it significantly reduces the difficulty of operation and the risk of complications. It is particularly suitable for clinical scenarios such as difficult airway management, emergency intubation, anesthesia induction and intensive care. The device is widely used in anesthesiology, emergency department, ICU, pre-hospital emergency, military medical care and medical teaching, and is one of the important tools for modern airway management.
