Vitamins are organic compounds that are required by living organisms in minute quantities to maintain a normal metabolic activity. These compounds usually cannot be synthesized by the organism and have to be obtained through external sources. The term “vitamin” is a generic descriptor for a group of chemical compounds or ingredients that have similar molecular structure and have the capability to perform the required vitamin-activity. These chemical compounds or vitamin ingredients are often called as vitamers. There are thirteen different known types of vitamins with each type having multiple vitamers. Vitamin B-complex refers to a group of water-soluble vitamers that although co-exist together are distinct in chemical structure and functions.

The demand for vitamins, and particularly for Vitamin B ingredients, has been on a continuous rise over the past two decades, owing to radical changes in lifestyles and diet patterns. Vitamin B disorders are often associated with either genetic causes or processed food consumption. This has led to a huge market for Vitamin B supplements and their associated ingredients.
