Vitamins are of two sorts — water soluble (A, D, E, and K) and fat soluble (vitamin B and vitamin C). Vitamin B can be of the following types B1 (thiamine), B2(riboflavin), B3 (niacin), B5 (pantothenic), B6, B12, B9, and B7. The chemical ingredients that constitute vitamins are called vitamers. Vitamins can contain multiple vitamers. For example, Vitamin A contains six vitamers — retinal, retinol, and four types of carotenoids. Human body does not produce vitamin by itself, so human beings depend on secondary sources such as food and supplements for vitamins.

With an increasing number of customers taking responsibility of their health and well-being, the global market for vitamin ingredients has been witnessing a substantial rise since the last few years. The rising awareness among people about lifestyle diseases and preventive healthcare has been boosting the demand for vitamin ingredients substantially across the world.
