The global Vitrification and Thawing Media market size is predicted to grow from US$ 109 million in 2025 to US$ 131 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

Vitrification and Thawing Media is intended to be used for the vitrification of human blastocysts for ART procedures.

Vitrification and Thawing Media (Vitrification and Thawing Media) are special media used during in vitro fertilization (IVF) and embryo freezing to vitrify and thaw eggs and embryos. Vitrification is a commonly used embryo cryopreservation technique for the preservation of eggs, fertilized eggs, and blastocysts. During vitrification, eggs or embryos are placed in a highly concentrated protective solution and then quickly frozen to very low temperatures to prevent the formation of ice crystals and reduce the risk of cell damage. The vitrification medium acts to protect cells during freezing, ensuring that cells maintain their integrity and viability during freezing and thawing. Thawing media are special liquids used to thaw frozen eggs or embryos from their vitrified state. The formula and composition of the thawing medium are similar to the vitrification medium, but it helps restore the osmotic balance and physiological state of the cells, and reduces the damage to the cells during the thawing process.
