VMAT2 inhibitors are a class of medications that block the vesicular monoamine transporter 2 (VMAT2) protein, which plays a crucial role in transporting neurotransmitters like dopamine, norepinephrine, and serotonin into synaptic vesicles in the brain. VMAT2 inhibitors are primarily used to treat movement disorders like tardive dyskinesia and Huntington's disease, where they help control involuntary movements (chorea). Medications in this class, such as tetrabenazine and deutetrabenazine, selectively target dopamine pathways, reducing unwanted motor symptoms while typically minimizing some of the side effects associated with other dopamine-suppressing drugs.
