VOCs (Volatile Organic Compounds) are a class of common pollutants that typically originate from industrial production, vehicle exhaust, paints, cleaning agents, solvents, and more. These compounds can form harmful substances like ozone in the atmosphere, posing risks to both the environment and human health. Therefore, treating VOC emissions is an important task for environmental protection and public health. A VOC (Volatile Organic Compounds) Processing System for the printing industry is designed to capture and treat harmful volatile emissions produced during printing processes, ensuring compliance with environmental regulations and enhancing air quality. These systems typically utilize technologies like activated carbon adsorption, catalytic oxidation, or thermal oxidizers to remove or reduce VOCs such as solvents and other chemicals released from inks, coatings, and cleaning agents.

United States market for VOC Processing System for Printing Industry is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
