Voith Schneider Propeller (VSP) is a type of the azimuthing propulsor which generates thrust by means of profiled blades that project from the bottom of the ship. The blades are mounted in a rotor casing that is flush with the bottom of the ship. The energy required to rotate the rotor casing is supplied by an engine via the reduction gear and the bevel gear. The rotor casing is axially supported by the thrust plate and centered radially by the roller bearing. The blades perform an oscillating motion controlled by the crank-type kinematics system. The amplitude and phase of this motion is determined by the position of the lower end of the pivoting control rod.
