Abstracts

The global Volatile Hydride market size is predicted to grow from US$ 1590 million in 2025 to US$ 2281 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2024, global Volatile Hydride production reached approximately 13,400 tons, with an average global market price of around US$ 115,500 per ton. Volatile Hydride refers to a class of chemical compounds composed of hydrogen and a less electronegative element (typically a metalloid or nonmetal), which are characterized by their tendency to exist as gases or easily vaporize at room temperature. These hydrides, such as arsine (AsH?), phosphine (PH?), and silane (SiH?), are notable for their high volatility, allowing them to be transported and introduced in gaseous form during chemical processes. They are commonly used as precursors in semiconductor manufacturing, thin-film deposition, and analytical techniques like hydride generation atomic absorption spectroscopy. Their high toxicity and reactivity require careful handling under controlled conditions.

The market for Volatile Hydride is primarily driven by their critical role as high-purity precursor gases in the semiconductor industry, where compounds such as arsine (AsH?), phosphine (PH?), and silane (SiH?) are essential for doping and epitaxial layer deposition in the fabrication of microelectronics, LEDs, and solar cells. Growing demand for advanced electronics, including high-speed chips, optoelectronic components, and photovoltaic devices, is pushing consumption upward. Additionally, their use in Hydride generation atomic absorption spectroscopy for trace elemental analysis in environmental and pharmaceutical testing contributes to market growth. The shift toward miniaturized and high-performance electronic devices, combined with increased investment in clean energy technologies, further accelerates demand for these highly specialized and ultra-pure hydrides.
