The global Volatile Organic Compounds (VOCs) Treatment System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Volatile organic compounds (VOCs) are all those organic compounds that exist in a gas or very volatile liquid state at ordinary room temperature. Formally VOCs are all those organic compounds that have a vapour pressure equal to or higher than 0.01 kPa or an equivalent volatility in the particular conditions of use at 20°C. VOCs usually have less than twelve carbon atoms in their chain and contain other elements such as oxygen, fluoride, chlorine, bromine, sulphur or nitrogen.

Treatment technologies can be divided in two groups: the destructive and non-destructive. Destructive treatments are those in which the VOCs are transformed into other substances through an adequate procedure, while non-destructive treatment consists of the physical or chemical separation of VOCs from the air to be treated.
