Volatile Organic Matter Analyzer (VOMA) is an analytical instrument used to measure the concentration of volatile organic compounds (VOCs) in various samples such as air, water, and soil. Volatile organic compounds are organic chemicals that have high vapor pressure at room temperature, which means they are easily evaporated and spread through the air. Volatile organic compounds can have harmful effects on human health

and the environment, and their concentrations are regulated by various environmental agencies. VOMA is used to measure the concentration of these compounds to monitor compliance with environmental regulations and identify potential sources of pollution. VOMA typically captures VOCs by extracting air or water samples through adsorption materials such as activated carbon or polymer resins. Then heat the adsorbent material and release the volatile organic compounds into a gas chromatograph (GC) or mass spectrometer (MS) for analysis. Separate and identify individual VOCs present in the sample by GC or MS, and measure and report the concentration of each compound.
