Abstracts

The global ?Steel Pipe Assembly market size is predicted to grow from US$ 636 million in 2025 to US$ 870 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

In 2024, global steel pipe assembly production reached approximately 3887 k units, with an average global market price of around US$ 160 per unit. Steel pipe assembly means a complete, independent piping unit assembled from steel pipe, connecting joints (such as flanges, threaded joints, quick connectors, etc.) and possible other accessories. It does not refer to a single steel pipe, but a functional module with specific functions and ready-to-use.

The demand for steel pipe assemblies is mainly driven by investment in traditional fields such as energy infrastructure, engineering machinery and high-end equipment manufacturing, while emerging green and low-carbon industries such as hydrogen storage and transportation, carbon capture and utilization and storage are generating strong demand for high-performance pipelines. The current business opportunities not only exist in the standardized product market meeting the traditional infrastructure, but also lie in two high-value directions: one is the localization of special pipe fittings that break through high-tech barriers and replace imports; the other is the transformation from single part supply to pipeline system solutions with pre-assembly, modularization and intelligent monitoring functions. By participating in the early design of customers and providing full life cycle management services, the right to speak and profit space of the industrial chain will be enhanced.

The annual production capacity of a single steel pipe assembly line is typically 20,000-30,000 pieces per year, with a gross profit margin of around 26%.
