A wafer mapping system is an automated device used in semiconductor manufacturing to scan and record data on chip defects and electrical properties on wafers. It supports production monitoring by generating detailed defect distribution maps and test maps. Its main significance lies in improving the yield and efficiency of wafer manufacturing. By accurately identifying the locations and types of defects, it optimizes the production process and reduces production costs. Its functions include defect detection, chip performance testing, data visualization, and integration with the Manufacturing Execution System (MES), and it is suitable for quality management and equipment commissioning in wafer fabs. Its advantages are high precision, high throughput, and data-driven decision-making support, which can significantly reduce the defect rate and accelerate the time-to-market of products..
