Wafer probe table lighting AOI is a technology and equipment used to detect surface defects and issues on wafers during semiconductor manufacturing processes. The wafer probe stage lighting AOI combines optical imaging technology and image analysis algorithms to ensure the quality and consistency of the wafer by conducting automated optical inspections of the wafer surface. In the semiconductor manufacturing process,

wafers are the fundamental materials of semiconductor chips, processed and manufactured through a series of process steps. The wafer probe table AOI is mainly used to detect defects and defects on the wafer surface, such as scratches, contamination, inconsistent line width, and line breakage. It captures images of wafer surfaces through a high-resolution optical imaging system, and then processes and analyzes the images using image analysis algorithms to detect and identify defects. The working principle of AOI for wafer probe table lighting can be summarized as the following steps: wafer loading: placing the wafer to be tested on the probe table, usually automated loading is achieved through a mechanical loading mechanism. Optical imaging: Use a high-resolution optical imaging system to capture images of the wafer surface. These images can include different perspectives, wavelengths, or multispectral images to obtain more information. Image processing and analysis: The collected images are processed and analyzed through image processing and analysis algorithms. These algorithms can detect defects, analyze line width and shape, compare differences between images and templates, and so on. Defect detection and classification: According to predefined rules and algorithms, the wafer probe table lighting AOI will detect and classify defects on the wafer surface. Defects can be classified based on their severity and type for subsequent processing and judgment. Result output and report generation: Based on the detection results, the wafer probe table lighting AOI will generate corresponding detection reports, recording the defect situation and location of the wafer for subsequent analysis and processing. The AOI technology of wafer probe table lighting can improve product quality control and production efficiency in semiconductor manufacturing processes. It can automatically detect defects on the surface of wafers, reducing the possibility of manual operations and errors, thereby improving production efficiency.
