Abstracts

The global Wafer Reclamation and Polishing market size is predicted to grow from US$ 465 million in 2025 to US$ 704 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Wafer Reclamation and Polishing refers to a comprehensive set of re-manufacturing processes applied to used, retired, or surface-damaged silicon wafers to restore their surface quality, flatness, roughness, and cleanliness to levels suitable for reuse in non-product wafer applications within semiconductor manufacturing. These processes typically include film stripping, wafer thinning and grinding, chemical mechanical polishing (CMP), ultra-clean washing, defect repair, metal contamination control, and surface metrology. Through these steps, previously consumed wafers are transformed into reusable monitor wafers or dummy wafers, significantly reducing wafer consumption and minimizing material waste in fabs.

After reclamation and polishing, the wafers resemble new polished wafers in appearance, featuring low surface roughness, high flatness, and reduced defect density, with optional thermal oxide or functional layers added depending on the process requirement. As semiconductor fabs expand capacity, enhance process-control intensity, and pursue ESG and circular-manufacturing goals, wafer reclamation and polishing has become a critical enabling service for cost optimization, supply-chain resilience, and sustainable manufacturing—particularly across etching, CVD/ALD, cleaning, and lithography alignment applications.

United States market for Wafer Reclamation and Polishing is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
