The silicon wafer polishing process is to remove the micron-level and nano-level materials on the surface of the silicon wafer through the corrosion effect of the chemical solution in the polishing liquid and the removal effect of the mechanical grinding in the polishing liquid, so as to improve the surface morphology of the silicon wafer and improve the silicon. The process of micro-roughness of the chip surface, the corresponding equipment is called the wafer Surface Planer.

Following a strong growth of 26.2 percent in the year 2021, WSTS revised it down to a single digit growth for the worldwide semiconductor market in 2022 with a total size of US\$580 billion, up 4.4 percent.
