The global Waist High Turnstiles market size is predicted to grow from US\$ 170 million in 2025 to US\$ 210 million in 2031; it is expected to grow at a CAGR of 3.5% from 2025 to 2031.

Waist high turnstiles are a type of pedestrian turnstile that is designed to control access to a facility by only allowing people to pass through one at a time. They are typically used in areas where security is not as critical as it would be in a full-height turnstile, such as office buildings, schools, and hospitals.

Waist high turnstiles are made up of two or three arms that are spaced apart to allow people to pass through. The arms are typically made of metal or plastic, and they are often covered with a decorative material.

Waist high turnstiles can be operated manually or automatically. Manual turnstiles require a person to insert a card or swipe a badge in order to unlock the arms. Automatic turnstiles use a sensor to detect when someone is approaching, and they automatically unlock the arms.

The growth of the market is being driven by a number of factors, including:

The increasing demand for security: Waist high turnstiles are used to control access to a facility and to prevent unauthorized entry. This is especially important in areas where security is a priority, such as schools, hospitals, and government buildings.

The increasing demand for crowd control: Waist high turnstiles can be used to control the flow of people through a facility. This is important in areas where there is a lot of foot

traffic, such as retail stores and gyms.

The increasing demand for automation: Waist high turnstiles can be automated, which can improve efficiency and reduce the need for manpower.

The increasing demand for customization: Waist high turnstiles can be customized to meet the specific needs of a facility. This can include features such as different colors, materials, and security levels.
