The wall-type counter-swirling burner is a combustion device specially designed for boiler systems. It optimizes the rotational flow of combustion air to improve the combustion efficiency of fuel. The burner adopts a counter-swirling air flow design, which makes the air produce a strong rotation effect when entering the combustion chamber, promotes the mixing of fuel and air, and ensures a full and uniform combustion process. This design helps to improve thermal efficiency, reduce pollutant emissions, and can adapt to various types of fuels. Wall-type counter-swirling burners are widely used in high-load, high-efficiency energy systems such as industrial boilers and thermal power plants.
