The washer heater element is an electric heater that heats the water from the hose that connects to the washer's central water supply. It is usually made of V or W pipe. It contains a high resistance conductive element and can withstand very high operating temperatures. In addition, the heating coil is surrounded by a special insulator dielectric with excellent thermal conductivity. It is used to absorb the heat from the heating

element and transfer it to the outer part made of steel, working together with the thermal sensor. When the water has heated to the proper level, the sensor transmits this data to the control unit, and the heating is stopped. Calculating corrosion in hard and chlorinated water is one of the most important factors in the accurate design and manufacture of electric immersion heaters.
