Waste to Energy Stoker Fired Boilers refer to a type of boiler system used in waste-to-energy plants to convert municipal solid waste (MSW) into energy. These boilers employ a stoker, which is a mechanical system that moves the waste through the combustion chamber, ensuring efficient burning. The waste, once fed into the boiler, is subjected to high temperatures, producing heat. This heat is used to generate steam, which can then be utilized to produce electricity or supply heating. Stoker fired boilers are known for their ability to handle a wide range of waste materials, making them a versatile and efficient solution for waste management and energy production.

The global Waste to Energy Stoker Fired Boilers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
