The global Wastewater Treatment Agent market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Chemicals used to treat wastewater are called wastewater treatment agents. These chemicals are used to remove pollutants and harmful substances from wastewater, thus achieving the goal of purifying wastewater.

Common wastewater treatment agents include:

Oxidants: Oxidants can oxidize pollutants into compounds that are easier to remove. The most common oxidants are hydrogen peroxide, potassium permanganate, and ozone.

Flocculants: Flocculants can make suspended solids and particles in wastewater settle down. The most common flocculants are iron hydroxide, aluminum hydroxide, and lime.

Chelating agents: Chelating agents can combine metal ions in wastewater with chelating agents to form chelate complexes, thereby removing metal ions in wastewater. The most common chelating agents are EDTA, DTPA, and oxalic acid.

Biodegradation agents: Biodegradation agents can use microorganisms to degrade organic substances in wastewater. The most common biodegradation agents are aerobic bacteria and anaerobic bacteria.

These treatment agents are usually added to the industrial wastewater treatment

system in a certain proportion to ensure the quality and treatment effect of the wastewater. At the same time, these agents need to be treated specifically after use to prevent environmental pollution.

United States market for Wastewater Treatment Agent is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
