## **Abstracts**

The global Wastewater Treatment and Reuse for Semiconductor market size is predicted to grow from US\$ 1694 million in 2025 to US\$ 2746 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Semiconductor wastewater treatment and reuse refers to a systematic solution that involves the classified collection, differentiated treatment, and deep purification of various wastewater generated during wafer manufacturing processes (such as CMP, casing, etching, cleaning/wet processes, electroplating/chemical plating, etc.), advanced packaging, and ultrapure water preparation concentrate discharge. The treated water, along with some of the deeply treated water, is then reused as process water, cooling water, or upstream of ultrapure water preparation.

This product is typically delivered as a "process package + complete system (equipment + control system) + engineering implementation + operation and maintenance/managed services." The technology path covers unit processes such as physicochemical, biochemical, membrane separation, advanced oxidation, and evaporation crystallization. Its core value lies in achieving high recovery rates and low-risk integrated management of water conservation and emission reduction while ensuring stable and compliant emissions from the wafer fab.

United States market for Wastewater Treatment and Reuse for Semiconductor is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
